Concept:
Students can search for tutors by subject and receive a list of local tutors.

The following technologies were used to build Better Brains:
HandleBars to template the front-end, HTML, CSS, JavaScript, MySQL for the database, Sequelize as an ORM, Node.js and Express for the back-end.

How to demo:
This app is far from complete and is currently being rebuilt in React.js. The basic functionality is there though. Sign up as either a student or a tutor on the top right. In the search bar search either Math or Biology since those are the only subjects that we currently have tutor data for right now. Just play around with it and see what it can do. This was built in two weeks for a class project. A lot of growth as a developer has occurred since building this app.
